

CVACS

COVID-19 VACCINE SURVEY

SOUTHERN AFRICA LABOUR AND DEVELOPMENT RESEARCH UNIT
UNIVERSITY OF CAPE TOWN

SURVEY 1 PRELIMINARY RESULTS (N = 1940)

- The COVID-19 Vaccine Survey was born out of the vision of the Bill & Melinda Gates Foundation.
- CVACS is conducted by the Southern Africa Labour and Development Research Unit, University of Cape Town.
- Results in this presentation are based on partial data from Survey 1 of CVACS.
- It is important to note: The results presented here have not yet been adjusted using survey weights
- Findings therefore must not be interpreted as representing the beliefs/opinions/choices of all unvaccinated individuals in South Africa.
- Our findings provide a picture the beliefs/opinions/choices of the sample of unvaccinated individuals that we found and interviewed.

Purpose & aims

Provide high quality, timely information on barriers and facilitators to COVID-19 vaccine uptake in South Africa

Provide rapid answers to the most pressing policy-relevant questions to support vaccine demand creation strategies

Track individuals through the surveys to understand who gets vaccinated and why

Test the impact of different messages

Rapidly share results and data

Overview

Repeated, brief telephone surveys with same respondents

Large sample ($\pm N=3500$), broad coverage
Unvaccinated at baseline

Rapid and responsive cycles to inform policy and programs

Stakeholder crowdsourcing of survey instrument

Data and results sharing

Timeline

 Survey  Results  Data release

- The full results for Survey 1 will be released in January 2022.
- The Survey 1 data will be available around the end of January 2022.
- Survey 2 will start mid-end-February, with results released ± 1 month later, and data released around the middle of April.

- The CVACS Consultative Group provided key input for the study design and the survey instrument, and helped to facilitate the crowdsourcing of questions.
- We are very grateful for their contributions, which have helped ensure the information is valuable for policy and strategy.

Key findings and implications

There are **4 distinct groups** of unvaccinated individuals (based on future intentions). Demand creation/promotion and service delivery must be tailored and targeted to each group

Close intention → behavior gap. Make vaccination easy and **frictionless**. Bring services to people. **Convenient, friendly** vaccination services.

Similar to the ASAP group, but **lower motivation**. May not see the benefit from or need for vaccine, but **unlikely to push back** against mandates.

Change mental models about **what they are waiting for**. Address **fears about consequences** of vaccination. Make salient **how many others like them** have been vaccinated (so-called "social proof" interventions).

Hard to counter the belief that vaccine will "kill" or harm you. Intervene to **prevent spread of misinformation**.

Sample

Discussions with policy makers and demand creators.

3500 unvaccinated individuals

Credit bureau database overlaid with EA level dwelling structure and Census 2011 SAL+ information.

Sampling stratified on

Neighbourhood Lifestyle Index - modelled

Location - province, metro, non-metro urban, non-metro rural

Population group - modelled

Gender

Relevant vaccination age categories

- Credit bureau data contains those with credit checks run, not only credit application.

Recruitment

Initial strategy

Exact person sampled - recruitment low and progress slow.

Most who answered the phone were the sampled individual.

Revised strategy

Attempting to recruit any adult who answered the phone.

Most demographics and lucky prize draw details moved to the end.

Higher than expected reported vaccination level

Survey 1: Data collection

Survey

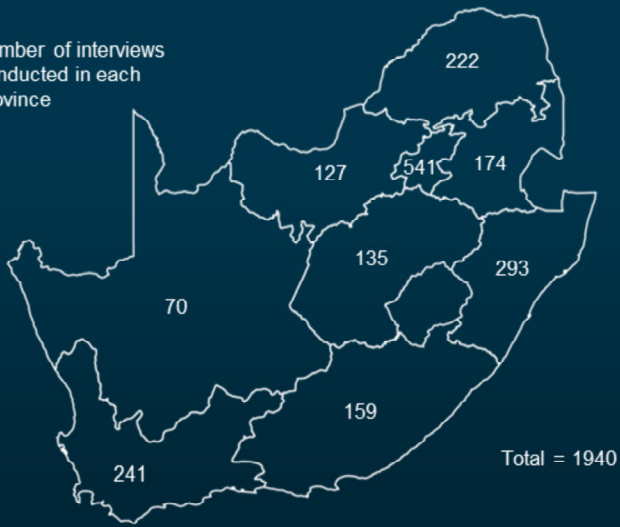

Results

- The vast majority of information collected is from the period after the announcement of the Omicron variant
- The results in this presentation are for a sample of 1940 individuals

Surveys conducted

Number of interviews conducted in each province

Types of households that have completed the survey

■ Traditional ■ Township/Informal ■ Formal residential ■ Farm/Smallholding

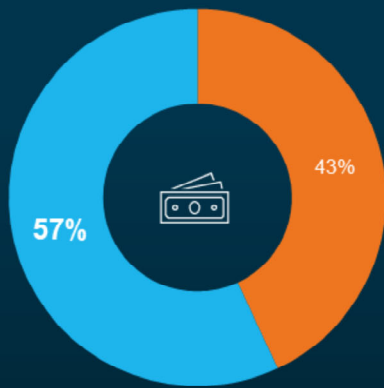

Respondents

by age group and gender

Male Female

Socioeconomic status

Earned any money in the past week

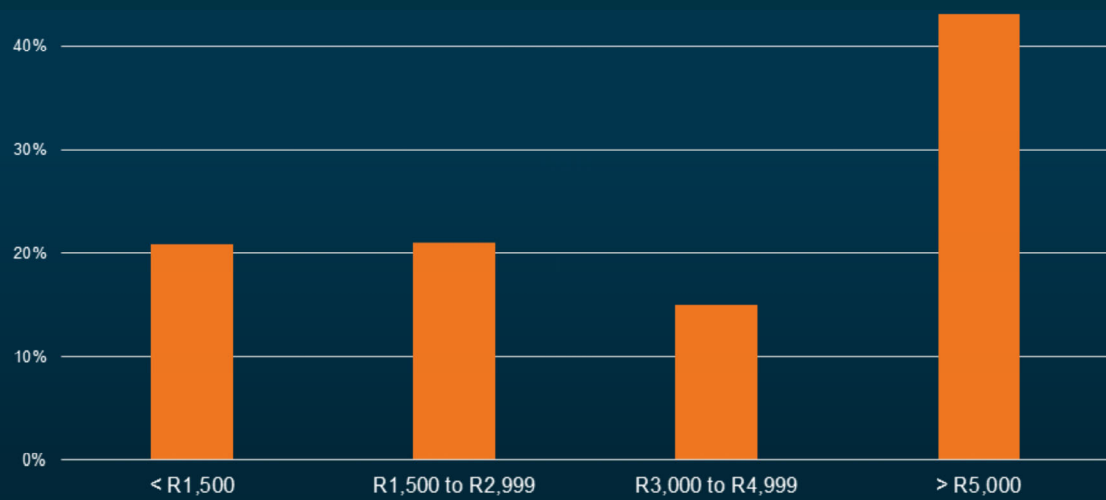

Completed Matric/Grade 12

Has medical aid/health insurance

■ Yes ■ No

Total household income (last month)

Note: 25% of sample did not provide data

- It is important to note that non-response to this question will likely have influenced the distribution.

Household characteristics

Someone went hungry in the past week

Own an internet enabled device

Access to piped water

■ Yes ■ No

COVID-19 information

I know someone who got very sick or died from COVID-19

I have had COVID-19

At least one household member is vaccinated

■ Yes ■ No

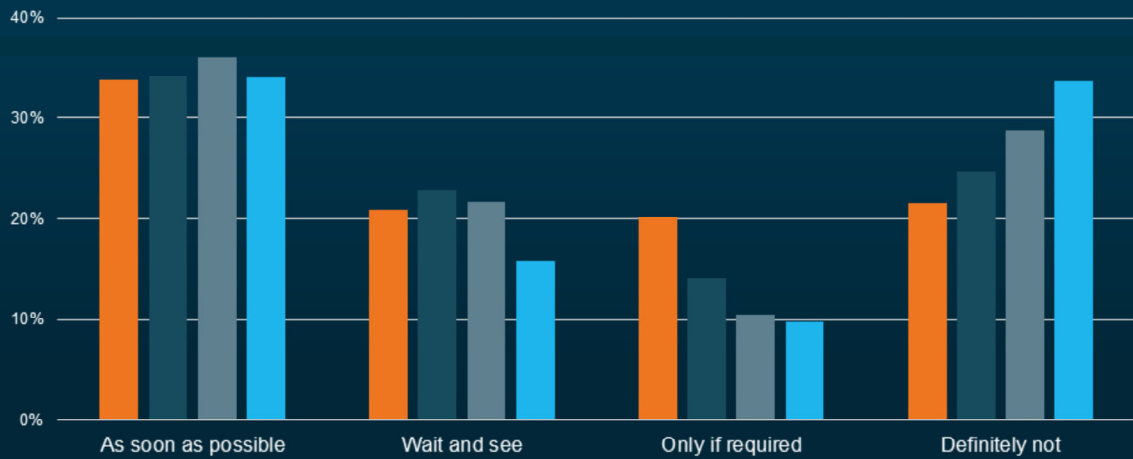

Do you plan to get vaccinated? If so, when?

Regarding the COVID-19 vaccine, do you plan to: 1. get it as soon as possible, 2. wait and see, 3. only get it if it is required (for example, if it is required for school or work) or 4. definitely not get it?

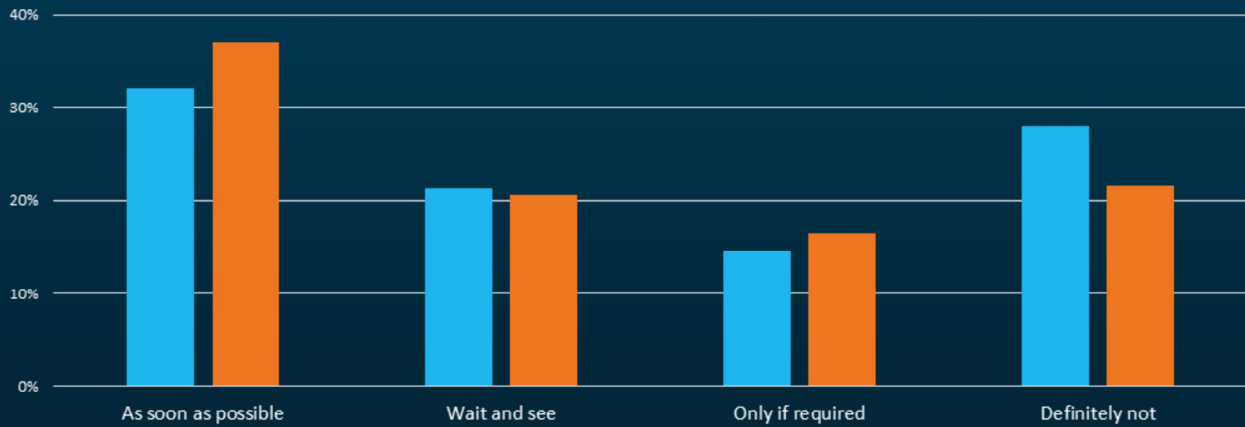

- In addition to the responses shown here, 4% of respondents said “Don’t know” and less than 1% refused to answer the question.

Plan to get vaccinated by age groups

18 - 34 35 - 49 50 - 59 60+

Plan to get vaccinated by gender

Male Female

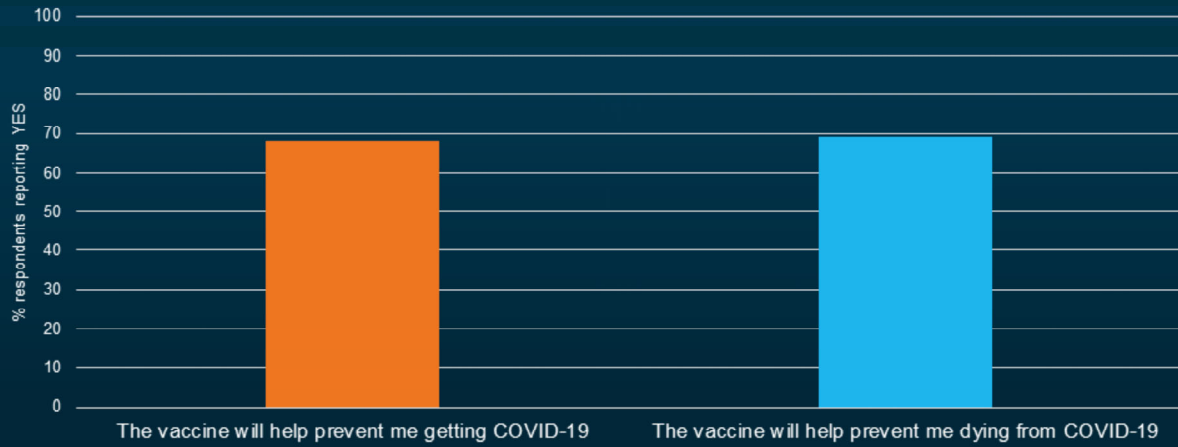

Who are the ASAP group?

■ My household income is below R5 000
■ I have medical aid

Perceived efficacy of vaccines

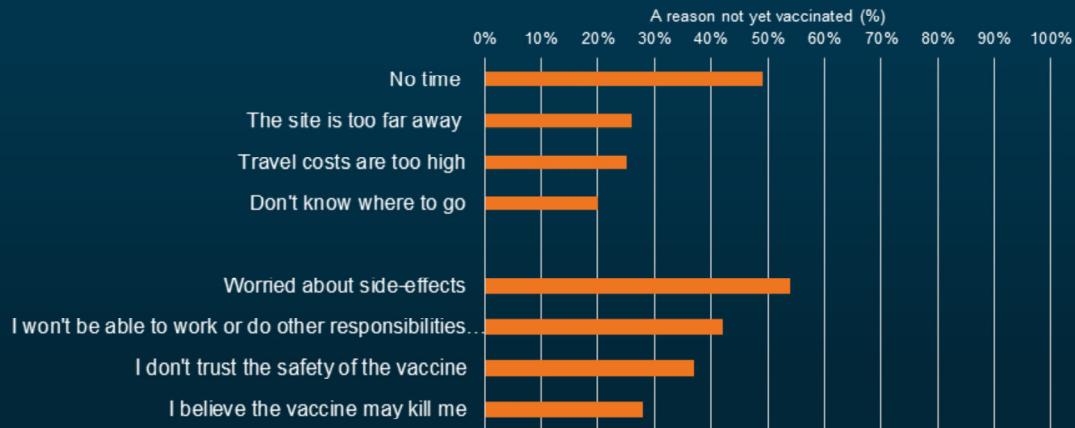

What is the single biggest reason that you are not yet vaccinated?

- Method: Thematic analysis.
- These are the most common themes. The largest words are the most frequent themes.

Why have you not been vaccinated yet? Is it because...

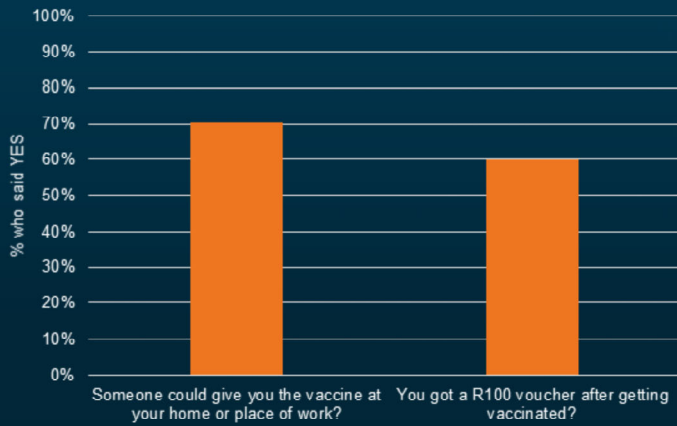

- We asked participants a set of questions about reasons for not having been vaccinated and for each they could respond "Yes" or "No"
- In addition to the data shown on the slide, among respondents who reported having had COVID-19 (N=83) 47% responded "Yes" to the question: Is it because...I have already had COVID-19

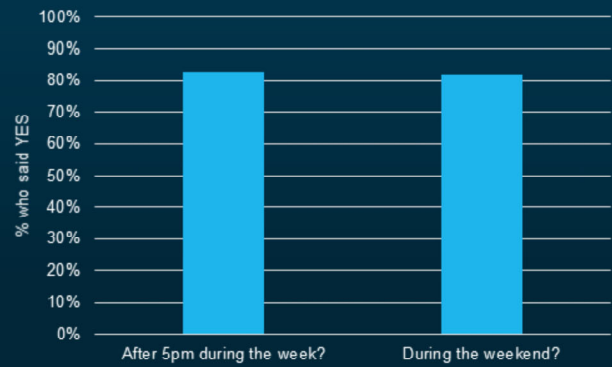

Potential interventions to increase vaccine uptake

Would you get vaccinated next week if...

Earlier you said you don't have time to get vaccinated. Would you have time if the vaccination site closest to you was open at the following time:

Potential interventions to increase vaccine uptake

If a person wants to get vaccinated, do they need to register and wait for an SMS back or can they go straight to any vaccination site?

Are some pharmacies providing COVID-19 vaccinations?

Perceived vaccine efficacy

by vaccine intentions

- I believe the vaccine will help prevent me getting COVID-19
- I believe the vaccine will help prevent me dying from COVID-19

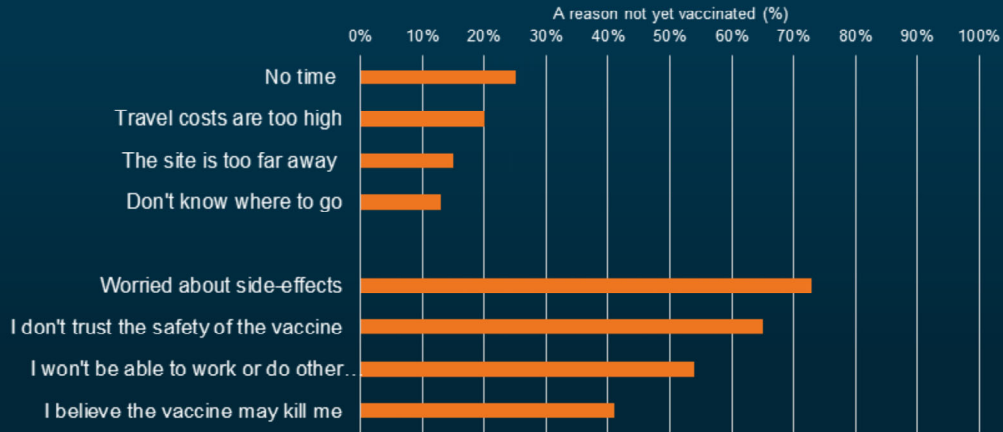

What is the single biggest reason that you are not yet vaccinated?

distrust-vaccine
unready wait-and-see
stories/rumours
no-need/healthy
makes-people-sick
sick/chronic-illness
afraid/unsure-safety
death side-effects
no-time/busy
not-effective
religion/culture

- Method: Thematic analysis.
- These are the most common themes. The largest words are the most frequent themes

Why have you not been vaccinated yet? Is it because...

- We asked participants a set of questions about reasons for not having been vaccinated and for each they could respond "Yes" or "No".
- In addition, among respondents who reported having had COVID-19 (n=65) 60% responded "Yes" to the question: Is it because...I have already had COVID-19

- Method: Thematic analysis.
- These are the most common themes of side effects that those in the wait and see group, concerned about side effects, are most worried about. The largest words are the most frequent themes.

Why don't you trust the
COVID-19 vaccine?

“

Many people that were close to me
died after taking the vaccine

I keep hearing different stories

Most people they get sick and die

People are dying because of the vaccine

Father passed away after vaccinating

My sister had chronic disease,
she was vaccinated and had complications

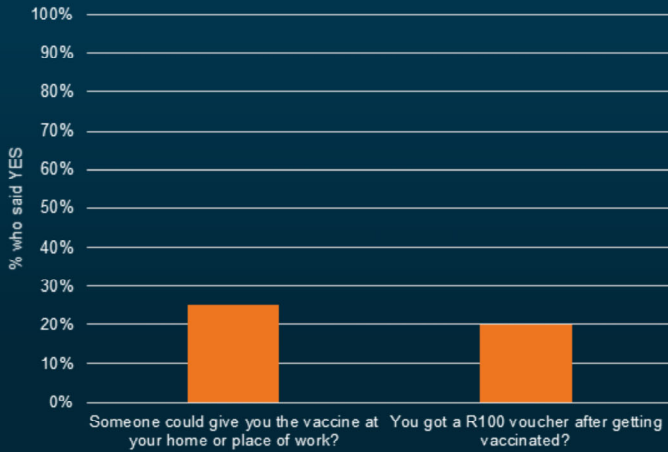

”

- Quotes are presented to exemplify some of the key themes that emerged from the question “Why don’t you trust the COVID-19 Vaccine?”.

Potential interventions to increase vaccine uptake

Would you get vaccinated next week if...

Earlier you said you don't have time to get vaccinated. Would you have time if the vaccination site closest to you was open at the following time:

Potential interventions to increase vaccine uptake

If a person wants to get vaccinated, do they need to register and wait for an SMS back or can they go straight to any vaccination site?

Are some pharmacies providing COVID-19 vaccinations?

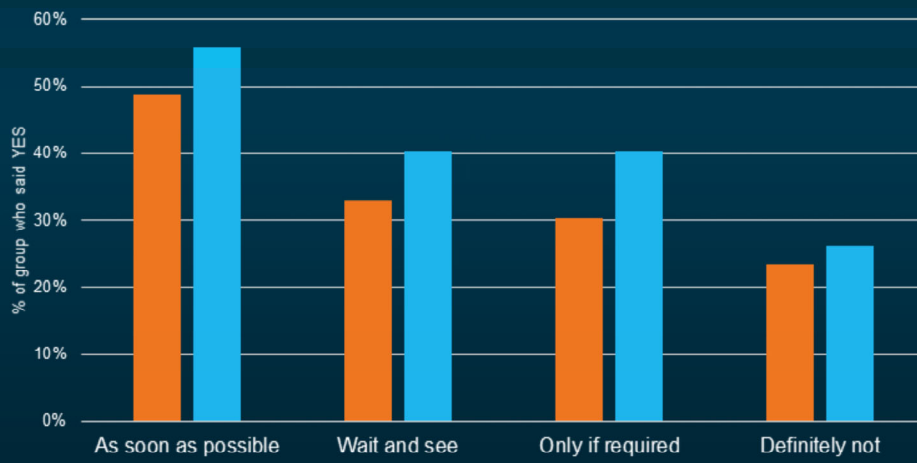

If there is one thing today that could convince you or help you get vaccinated, what would it be?

compensation
work/job
doctor-oks-it
more-information
safety-assurance
see-affect-on-others
efficacy-assurance
required/forced
if-i-get-better
if-i-get-sick

- Method: Thematic analysis.
- These are the most common themes. The largest words are the most frequent themes

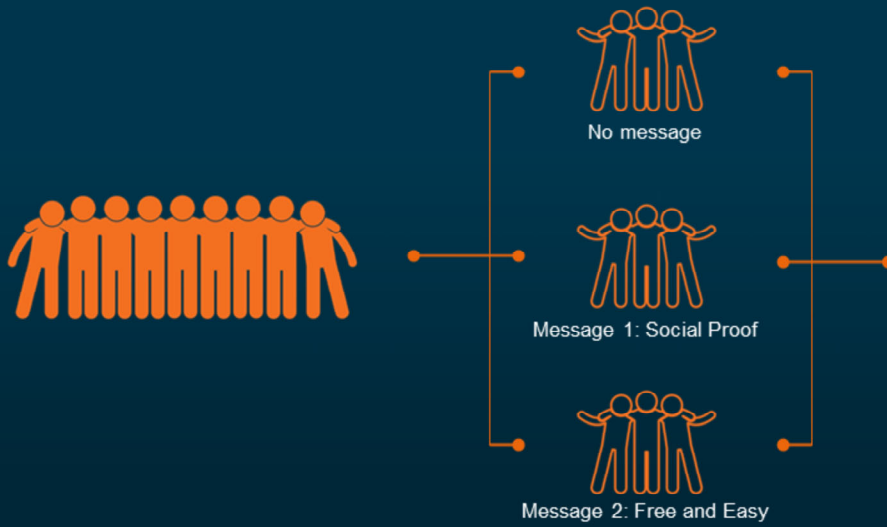

Potential network effects

- Most people in my area have been vaccinated
- Some people in the household have been vaccinated

Which messages change intentions?

We would like to contact you in February 2022 to talk again. By February, do you think you will have had a Coronavirus vaccine?

Message 1: Social proof

Over 15 million people in South Africa have already been vaccinated.
That's more people than everyone living in Johannesburg, Cape Town and Durban combined.

Did you know that?
[Yes or No]

INTERVIEWER READ OUT:

Yes, I was surprised too, but it's true. With those numbers you can really feel **confident that the vaccine is safe and effective.**

Message 2: Free and easy

Just as a reminder: **a free vaccine is available for you right now.** You don't need to register or make an appointment, and you don't need medical aid. You **can go straight down to your closest vaccine site** whenever it's open.

Did you know that?
[Yes or No]

INTERVIEWER READ OUT:

Yes, they've **made the process easier** than it was before. Registering before and waiting for an SMS with an appointment aren't necessary anymore.

Impact of messages over no message

Additional % of respondents reporting they will be vaccinated by February 2022 (above the no message group)

In conclusion

Key findings and implications

There are **4 distinct groups** of unvaccinated individuals (based on future intentions). Demand creation/promotion and service delivery must be tailored and targeted to each group

Close intention → behavior gap. Make vaccination easy and **frictionless**. Bring services to people. **Convenient, friendly** vaccination services.

Similar to the ASAP group, but **lower motivation**. May not see the benefit from or need for vaccine, but **unlikely to push back** against mandates.

Change mental models about **what they are waiting for**. Address **fears about consequences** of vaccination. Make salient **how many others like them** have been vaccinated (so-called "social proof" interventions).

Hard to counter the belief that vaccine will "kill" or harm you. Intervene to **prevent spread of misinformation**.

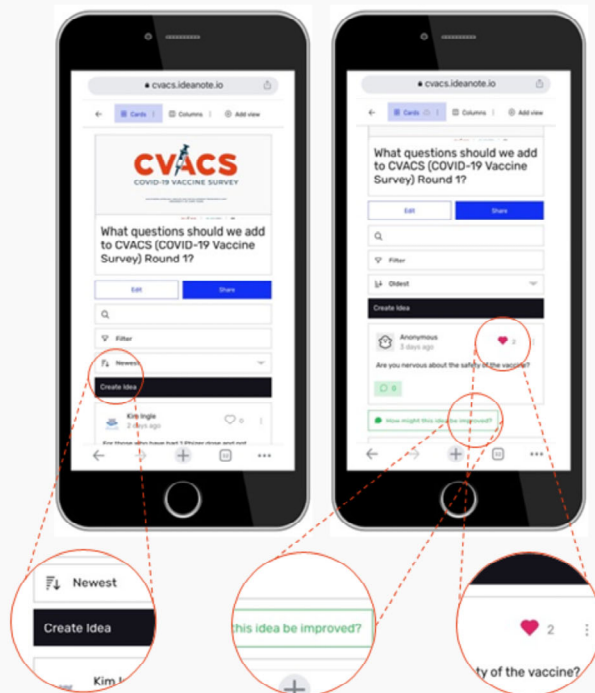

Crowdsourcing

We will solicit input on survey questions from a broad group of experts, policy makers, program leads, and frontline staff using an innovation platform called "ideanote"

Through ideanote, stakeholders can nominate questions for the survey instrument, as well as 'up-vote' and comment on questions submitted by others

- Access the Crowdsourcing Platform on IdeaNote here:
<https://cvacs.ideanote.io/login/link/52778025f463a84b6ad59778>

Thank you to Ask Afrika for conducting interviews

Without our respondents none of this would be possible - we thank them for their time

We will be drawing the winners of a lucky draw for our survey participants later in December

Second survey planned for February 2022
